Version: 4.0

Question:	1
-----------	---

An application contains an OSGi configuration that contains a password.

How should a developer prevent this sensitive information from being stored in plain text in JCR?

- A. 1. Use console at /system/console/crypto to encrypt the value
- 2. Either create an encrypted value for each AEM instance and use runmodes to apply the different values or make sure relevant instances share the same master key
- 3. When loading the value in the code, call CryptoSupport.unprotect(_) before using the value
- B. 1. Use console at /system/console/configMgr and tick the checkbox "encrypt" before saving a configuration
- 2. Use encrypted values work across all instances
- 3. When loading the value in the code, call CryptoSupport.unprotect(...) before using the value
- C. 1. Use console at /system/console/crypto to encrypt the value
- 2. Either create an encrypted value for each AEM instance and use runmodes to apply the different values or make sure relevant instances share the same master key
- 3. Sensitive information is automatically decrypted using the CryptoSupport OSGi service before the value is returned
- D. 1. Use console at /system/console/configMgr and tick the checkbox "encrypt" before saving a configuration
- 2. Either create an encrypted value for each AEM instance and use runmodes to apply the different values or make sure relevant instances share the same master key
- 3. Sensitive information is automatically decrypted using the CryptoSupport OSGi service before the value is returned

	Answer: A
Question: 2	

A custom bundle of an application is in state "Installed" after deploying it with Maven. What should a developer do to change it to state "Active"?

- A. Use the "Start" action for the bundle in the Apache Felix Web Console
- B. Ensure all OSGi requirements are met and re-deploy using Maven
- C. Use the "Update" action for the bundle in the Apache Felix Web Console
- D. Reinstall the content package using the package manager

Question: 3

A developer needs to implement a header component for a website. The component has the following requirements:

- The component should be configured once on the page highest in the hierarchy.
- The header component on pages lower in the hierarchy should look the same and show the same data.
- If necessary, the configuration can be overwritten on a child page.
- The component should show a list of links that are configured in the header component.

Which code snippet for returning the list of pages should the developer use?

```
A. "public String[] getHeaderLinks(Page page) {
  final Resource pageContent = page.getContentResource();
                           final
                                      ComponentInheritanceValueMap
                                                                             properties
ComponentInheritanceValueMap(pageContent);
  return properties.get(HEADER_PAGE_LIST, String[].class);
B. "public String[] getHeaderLinks(Resource componentResource) {
                           final
                                      ComponentInheritanceValueMap
                                                                             properties
componentResource.adaptTo(ComponentInheritanceValueMap.class);
  return properties.getInherited(HEADER_PAGE_LIST, String[].class);
C. "public String[] getHeaderLinks(Resource componentResource) {
   final HierarchyNodeInheritanceValueMap properties = new HierarchyNodeInheritanceValueMap
(componentResource);
  return properties.getInherited(HEADER_PAGE_LIST, String[].class);
D. "public String[] getHeaderLinks(Resource componentResource) {
                          final
                                    HierarchyNodeInheritanceVauleMap
                                                                             properties
componentResource.adaptTo(HierarchyNodeInheritanceVauleMap.class);
  return properties.getInherited(HEADER_PAGE_LIST, String[].class);
                                                                           Answer: C
```

Question: 4

A developer is creating a custom component on the page /latestBlogs that needs to list all the titles of the blogs pages under /content/blogs.

How does this component get the list of child pages?

A. Instantiate a node object with session.getNode(/content/blogs) and then iterate through the child nodes and print the title for each.

- B. Use the QueryDebugger to look for all children of /content/blogs and then iterate through the result set and print the title for each.
- C. Adapt the resourceResolver to the PageManger service, then use the getPage(/content/blogs) to instantiate a Page object and then iterate through the child pages and print the title for each.
- D. Use PageManager.getPage("/content/blogs") of the static PageManager class to instantiate a Page object and then iterate through the child pages and print the title for each.

	Answer: B
Question: 5	
A developer is working with the following HTL expression in a compone \${'path/page.infinity.json' @extension = 'html', removeSelectors = ['foo'], selectors = ['foo', 'bar'], prependSuffix = 'hello', suffix = 'world' } What is the expected output of this expression?	nt rendering script:
A. path/page.foo.bar/hello/world B. path/page.infinity.json.bar/world C. path/page.bar/hello/world D. path/page.bar/world	
	Answer: C
