**QUESTION & ANSWERS**

### Question: 1

USG A and USG B are configured with a static BFD session. The following is true about the process of establishing and tearing down a BFD session.

- A. USG A and USG B each start the BFD state machine. The initial state is Down and the BFD packet is Down. The value of Your Discriminator is 0.
- B. After the local BFD status of B USG B is Init, if you continue to receive packets with the status Down, you can re-process and update its local status.
- C. After receiving the BFD packet in the init state, C USG B switches the local state to Up.
- D. After the state transition of 'DOWN-->INIT' occurs on D USG A and USG B, a timeout timer is started. If the BFD packet is in the Init or Up state, the local state is automatically switched back to Down.

**Answer: C,D**

---

**Question: 3**

The constraints of the policy in the traffic limiting policy include quintuple, time period, user identity, and application protocol.

- A. TRUE
- B. FALSE

**Answer: A**

---

**Question: 4**

When using the optical bypass interface, the Bypass link has two working modes, automatic mode and forced mode.

- A. TRUE
- B. FALSE

**Answer: A**

---

**Question: 5**

In the application scenario of the virtual firewall technology, the more common service is to provide rental services to the outside. If the virtual firewall VFW1 is leased to enterprise A and the virtual firewall VFW2 is leased to enterprise B, what is the following statement incorrect?

- A. The A system provides independent system resources for the virtual firewalls VFW1 and VFW2, and does not affect each other.
- B. is transparent to users, and the business between enterprise A and enterprise B is completely isolated, just like using firewalls separately.
- C. Enterprise A and Enterprise B can overlap addresses and use VLANs to separate different VLANs.
- D. Enterprise A and Enterprise B cannot manage their own virtual firewalls independently and must be managed by the administrator of the lessor.

**Answer: D**

---

**Question: 6**

What are the scenarios in which the USG series firewall service port sends gratuitous ARPs when the following configurations are performed?

- A. routing mode + switch
- B. routing mode + router
- C. exchange mode + switch
- D. exchange mode + router

**Answer: C**

---

**Question: 7**

In the application scenario of IPSec traversal by NAT, the active initiator of the firewall must configure NAT traversal, and the firewall at the other end can be configured without NAT traversal.

- A. TRUE
- B. FALSE

**Answer: B**

---

**Question: 8**

The NAT/ASPF log in the session log and the DPI traffic monitoring log provide a "binary" output technology for this type of log. The use of binary input output can greatly reduce the impact on system performance, but The binary form output needs to be configured with the elog log management system.

- A. TRUE
- B. FALSE

**Answer: A**

---
